Levetiracetam in Pregnancy: Results From the UK and Ireland Epilepsy and Pregnancy Registers.

OBJECTIVES: Levetiracetam is a broad-spectrum antiepileptic drug (AED) which is currently licensed in the United States and the United Kingdom and Ireland for use as adjunctive treatment of focal-onset seizures and myoclonic seizures or generalized tonic-clonic seizures, occurring as part of generalized epilepsy syndromes. In the United Kingdom and Ireland, it is also licensed as monotherapy treatment for focal-onset seizures. Previous small studies have suggested a low risk for major congenital malformations (MCM) with levetiracetam use in pregnancy. METHODS: The UK and Ireland Epilepsy and Pregnancy Registers are prospective, observational registration and follow-up studies that were set up to determine the relative safety of all AEDs taken in pregnancy. Here we report our combined results for first-trimester exposures to levetiracetam from October 2000 to August 2011. RESULTS: Outcome data were available for 671 pregnancies. Of these, 304 had been exposed to levetiracetam in monotherapy, and 367 had been exposed to levetiracetam in combination with at least one other AED. There were 2 MCM in the monotherapy group (0.70%; 95% confidence interval [CI] 0.19%–2.51%) and 19 in the polytherapy group 5.56% (3.54%–8.56%) [corrected]. The MCM rate in the polytherapy group varied by AED regimen, with lower rates when levetiracetam was given with lamotrigine (1.77%; 95% CI 0.49%–6.22%) than when given with valproate (6.90%; 95% CI 1.91%–21.96%) or carbamazepine (9.38%; 95% CI 4.37%–18.98%). CONCLUSION: This study, in a meaningful number of exposed pregnancies, confirms a low risk for MCM with levetiracetam monotherapy use in pregnancy. MCM risk is higher when levetiracetam is taken as part of a polytherapy regimen, although further work is required to determine the risks of particular combinations. With respect to MCM, levetiracetam taken in monotherapy can be considered a safer alternative to valproate for women with epilepsy of childbearing age.

Levetiracetam is approved as an add-on treatment of myoclonic, primary generalized, and partial-onset seizures with or without secondary generalization. Its pharmacokinetic attributes have facilitated its wide clinical use. For example, levetiracetam has linear pharmacokinetics and rapid onset of action, is totally excreted by the kidneys, does not interact with other drugs, can be loaded intravenously or orally (6), is weight neutral, has no cognitive side effects, and does not require blood-level monitoring. These attributes have made levetiracetam a preferable first line AED treatment for many physicians despite its indication as adjunctive therapy in the United States. Thus, it is of great importance to assess the safety of levetiracetam in pregnancy.

Mawhinney et al. recently published important data about the safety of levetiracetam during pregnancy from the UK and Ireland Epilepsy and Pregnancy Registers, which complement other reports published since 2010 (Table). The authors collected outcome data on 671 women who became pregnant while receiving levetiracetam as monotherapy (304 pregnancies) or as part of AED polytherapy (367 pregnancies). They did not record serum AED levels or smoking and alcohol use as part of this study. In the monotherapy group, there were two cases with major congenital malformations (0.7%; 95% confidence interval [CI], 0.19–2.51%), and in the...
polytherapy group, there were 19 (5.56%; CI, 3.54–8.56%). Polytherapy, including levetiracetam, was associated with increased chances of cesarean delivery (126 cases) compared with levetiracetam monotherapy (73 cases) \( (p < 0.05, \chi^2) \). In addition, the dose of levetiracetam in the monotherapy group did not influence mean birth weight or mean gestational age. The mean daily dose of levetiracetam was 3,000 mg for cases with major malformations, 1,148 mg for cases of minor malformations, and 1,680 mg for those with no malformations. Although there is a clear trend for higher doses to be associated with major malformations, these numbers were not statistically significantly different \( (p = 0.09) \). Additionally, higher levetiracetam doses in the polytherapy group were associated with increased risk of spontaneous abortion \( (p = 0.02) \), but not of major malformations \( (p = 0.19) \). In the polytherapy group, seizure control, including specifically generalized tonic–clonic seizures in the first trimester, did not correlate with the risk of major congenital malformations. As regards different AED combinations in those on polytherapy, major malformations occurred in only 1.8% of those exposed to levetiracetam and lamotrigine compared with 6.9% in those exposed to levetiracetam and valproate, 9.4% in those exposed to levetiracetam and carbamazepine, and none in 20 pregnancies exposed to levetiracetam and topiramate. One of the children exposed to levetiracetam and lamotrigine has multiple digit abnormalities. Of note, while rat and rabbit data on fetal exposure to levetiracetam demonstrated increased risks of skeletal abnormalities, these abnormalities were observed with levetiracetam doses per surface area that are 12 times the maximum recommended dose in humans \( (2) \). In humans, only the cases reported in different registries (Table), only three cases of skeletal abnormalities related to fetal exposure to levetiracetam in the first trimester were reported by the Union Chimique Belge (UCB) registry \( (7) \).

The rate of major congenital malformations associated with exposure to levetiracetam monotherapy reported by Mawhinney et al. \( (0.7%) \) is comparable with that in the non-epilepsy population, and the dose of levetiracetam did not correlate with the risk. Demonstrating the safety of levetiracetam in pregnancy is of great clinical utility. Currently, many epileptologists try to switch to lamotrigine during or before planned pregnancy because of its known relative safety during pregnancy. Indeed, the North American registry reported comparable rates of major malformations between levetiracetam (11 of 450) and lamotrigine (31 of 1562) \( (p = 0.56, \chi^2) \). However, levetiracetam is easier to use because of known pharmacokinetic differences between the two drugs. For example, levetiracetam can be orally loaded \( (6) \), whereas lamotrigine requires complex titration schedules. Also, levetiracetam is 100% excreted by the kidneys, thus requiring less-frequent dose alterations during pregnancy than lamotrigine whose level continues to drop drastically during pregnancy. Moreover, in addition to its efficacy in focal epilepsy, levetiracetam is an excellent AED to use in myoclonic epilepsies, where lamotrigine may actually worsen the myoclonus.

Future studies should assess the relative safety of various AED combinations. Also, major congenital malformations may not be the only consequence of in utero exposure to AEDs, since the Neurodevelopmental Effects of Antiepileptic Drugs (NEAD) study demonstrated long-term cognitive adverse events related to in utero exposure to valproic acid \( (1) \). Thus, such longer term studies will further shed light on the longer term effects of in utero exposure to AEDs. The Liverpool and Manchester Neurodevelopment group partially answered this question when they reported a safer neurodevelopment profile of levetiracetam than valproate \( (9) \). Mawhinney et al. acknowledge the limitation of lacking a control, but unfortunately most registries do not contain a control group. It would be ideal for future studies to include a control group and to document serum levels of AEDs, as well as the intake of other medications and substances of abuse.

Instructions
The purpose of this form is to provide readers of your manuscript with information about your other interests that could influence how they receive and understand your work. Each author should submit a separate form and is responsible for the accuracy and completeness of the submitted information. The form is in four parts.

1. Identifying information.
   Enter your full name. If you are NOT the main contributing author, please check the box “no” and enter the name of the main contributing author in the space that appears. Provide the requested manuscript information.

2. The work under consideration for publication.
   This section asks for information about the work that you have submitted for publication. The time frame for this reporting is that of the work itself, from the initial conception and planning to the present. The requested information is about resources that you received, either directly or indirectly (via your institution), to enable you to complete the work. Checking “No” means that you did the work without receiving any financial support from any third party – that is, the work was supported by funds from the same institution that pays your salary and that institution did not receive third-party funds with which to pay you. If you or your institution received funds from a third party to support the work, such as a government granting agency, charitable foundation or commercial sponsor, check “Yes”. Then complete the appropriate boxes to indicate the type of support and whether the payment went to you, or to your institution, or both.

3. Relevant financial activities outside the submitted work.
   This section asks about your financial relationships with entities in the bio-medical arena that could be perceived to influence, or that give the appearance of potentially influencing, what you wrote in the submitted work. For example, if your article is about testing an epidermal growth factor receptor (DGFR) antagonist in lung cancer, you should report all associations with entities pursuing diagnostic or therapeutic strategies in cancer in general, not just in the area of EGFR or lung cancer.

   Report all sources of revenue paid (or promised to be paid) directly to you or your institution on your behalf over the 36 months prior to submission of the work. This should include all monies from sources with relevance to the submitted work, not just monies from the entity that sponsored the research. Please note that your interactions with the work’s sponsor that are outside the submitted work should also be listed here. If there is any question, it is usually better to disclose a relationship than not to do so.

   For grants you have received for work outside the submitted work, you should disclose support ONLY from entities that could be perceived to be affected financially by the published work, such as drug companies, or foundations supported by entities that could be perceived to have a financial stake in the outcome. Public funding sources, such as government agencies, charitable foundations or academic institutions, need not be disclosed. For example, if a government agency sponsored a study in which you have been involved and drugs were provided by a pharmaceutical company, you need only list the pharmaceutical company.

4. Other relationships
   Use this section to report other relationships or activities that readers could perceive to have influenced, or that give the appearance of potentially influencing, what you wrote in the submitted work.

Disclosure of Potential Conflicts of Interest

Section #1 Identifying Information

1. Today’s Date: 6/12/2012
2. First Name  Mohamad     Last Name Koubeissi  Degree MD
3. Are you the Main Assigned Author?  ☑ Yes  ☐ No
   If no, enter your name as co-author:
4. Manuscript/Article Title: Levetiracetam: More Evidence of Safety in Pregnancy
5. Journal Issue you are submitting for:  13.6

Section #2 The Work Under Consideration for Publication
Did you or your institution at any time receive payment or services from a third party for any aspect of the submitted
work (including but not limited to grants, data monitoring board, study design, manuscript preparation, statistical
analysis, etc.)?

Complete each row by checking “No” or providing the requested information. If you have more than one relationship
just add rows to this table.

* This means money that your institution received for your efforts on this study.
** Use this section to provide any needed explanation.
**Section #3  Relevant financial activities outside the submitted work.**
Place a check in the appropriate boxes in the table to indicate whether you have financial relationships (regardless of amount of compensation) with entities as described in the instructions. Use one line for each entity; add as many lines as you need by clicking the “Add” box. You should report relationships that were present during the 36 months prior to submission.

Complete each row by checking “No” or providing the requested information. If you have more than one relationship just add rows to this table.
